

METHOD FOR TRANSMITTING DISPLAY DATA

Abstract

The invention provides a method for transmitting display data between an electronic apparatus and a display. The electronic apparatus includes a display circuit, a first and a second memory block. The display device includes a third memory block. The method (a) connects the display device to the electronic apparatus, (b) the display device transmits first display parameters to the electronic apparatus and stores the first display parameters into the first memory block, (c) compares the first and second display parameters (d) forms a third parameters according to the comparison of the first and the second display parameters in step(c) and stores the third parameters into the second memory block, (e) transmits the third display parameters from the electronic apparatus to the display device and stores this into the third memory block, and (f) displays images according to the display parameters stored in the third memory block by the display device.
